1 Elliptic curves

1.1 Reduction of Weierstrass equations

In this subsection, we want to investigate the important constants of elliptic curves such as c_4 , c_6 , Δ , j by calculating equations with hands.

Step 1. The Riemann-Roch theorem proves that every curve of genus 1 with a specified base point can be described by the first kind of Weierstrass equation. Explicitly, the first form of Weierstrass equation is

$$y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6. \quad (1)$$

Step 2. *Elimination of xy and y .* Factorize the left hand side

$$y(y + a_1x + a_3) = x^3 + a_2x^2 + a_4x + a_6.$$

By translation

$$\boxed{x \mapsto x, \quad y \mapsto y - \frac{1}{2}(a_1x + a_3)}$$

we have

$$\begin{aligned} y^2 - (\tfrac{1}{2}(a_1x + a_3))^2 &= x^3 + a_2x^2 + a_4x + a_6, \\ y^2 &= x^3 + (\tfrac{1}{4}a_1^2 + a_2)x^2 + (\tfrac{1}{2}a_1a_3 + a_4)x + (\tfrac{1}{4}a_3^2 + a_6), \\ y^2 &= x^3 + \tfrac{1}{4}(a_1^2 + 4a_2)x^2 + \tfrac{1}{2}(a_1a_3 + 2a_4)x + \tfrac{1}{4}(a_3^2 + 4a_6). \end{aligned}$$

Introduce new coefficients b to write it as

$$y^2 = x^3 + \frac{1}{4}b_2x^2 + \frac{1}{2}b_4x + \frac{1}{4}b_6.$$

By scaling

$$\boxed{x \mapsto x, \quad y \mapsto \frac{1}{2}y}$$

we get

$$y^2 = 4x^3 + b_2x^2 + 2b_4x + b_6. \quad (2)$$

Step 3. *Elimination of x^2 .* By translation

$$\boxed{x \mapsto x - \frac{1}{12}b_2}$$

we have

$$\begin{aligned}
y^2 = 4 \left(x^3 - 3 \cdot \frac{1}{12} b_2 x^2 + 3 \cdot \frac{1}{12^2} b_2^2 x - \frac{1}{12^3} b_2^3 \right) \\
+ b_2 \left(x^2 - 2 \cdot \frac{1}{12} b_2 x + \frac{1}{12^2} b_2^2 \right) \\
+ 2b_4 \left(x - \frac{1}{12} b_2 \right) \\
+ b_6,
\end{aligned}$$

so

$$\begin{aligned}
y^2 &= 4x^3 + \left(4 \cdot 3 \cdot \frac{1}{12^2} b_2^2 - 2 \cdot \frac{1}{12} b_2^2 + 2b_4 \right) x + \left(-4 \cdot \frac{1}{12^3} b_2^3 + \frac{1}{12^2} b_2^3 - 2 \cdot \frac{1}{12} b_2 b_4 + b_6 \right) \\
&= 4x^3 + \frac{1}{12} (-b_2^2 + 24b_4) x + \frac{1}{216} (b_2^3 - 36b_2 b_4 + 216b_6).
\end{aligned}$$

Write it as

$$y^2 = 4x^3 - \frac{1}{12} c_4 x - \frac{1}{216} c_6.$$

We want to match the coefficients of y^2 and x^3 but also want the coefficients of $c_4 x$ and c_6 to be integers. Iterative scaling implies

$$\begin{aligned}
x \mapsto \frac{1}{6}x : \quad & 216y^2 = 4x^3 - 3c_4 x - c_6 \\
y \mapsto \frac{1}{36}y : \quad & y^2 = 24x^3 - 18c_4 x - 6c_6 \\
x \mapsto \frac{1}{6}x : \quad & 9y^2 = x^3 - 27c_4 x - 54c_6 \\
y \mapsto \frac{1}{3}y : \quad & y^2 = x^3 - 27c_4 x - 54c_6.
\end{aligned}$$

Thus, we get the famous third form of Weierstrass equation:

$$y^2 = x^3 - 27c_4 x - 54c_6. \tag{3}$$

Theorem 1.1. *Let*

$$E : y^2 = x^3 - Ax - B.$$

TFAE:

- (1) *A point (x, y) is a singular point of E .*
- (2) *$y = 0$ and x is a double root of $x^3 - Ax - B$.*
- (3) *$\Delta = 0$.*

Proof. (1) \Rightarrow (2) $\partial_y f = 0$ implies $y = 0$. $f = \partial_x f = 0$ implies x is a double root of $x^3 - Ax - B$. A determines whether x is either cusp or node. \square

2 Algebraic integer

2.1 Quadratic integer

Theorem 2.1. *Every quadratic field is of the form $\mathbb{Q}(\sqrt{d})$ for a square-free d .*

Theorem 2.2. *Let d be a square-free.*

$$\mathcal{O}_{\mathbb{Q}(\sqrt{d})} = \begin{cases} \mathbb{Z} + \sqrt{d}\mathbb{Z} & , d \equiv 2, 3 \pmod{4} \\ \mathbb{Z} + \frac{1 + \sqrt{d}}{2}\mathbb{Z} & , d \equiv 1 \pmod{4} \end{cases}$$

$$\Delta_{\mathbb{Q}(\sqrt{d})} = \begin{cases} 4d & , d \equiv 2, 3 \pmod{4} \\ d & , d \equiv 1 \pmod{4} \end{cases}$$

Example 2.1.

$$\Delta_{\mathbb{Q}(i)} = -4, \quad \Delta_{\mathbb{Q}(\sqrt{2})} = 8, \quad \Delta_{\mathbb{Q}(\gamma)} = 5, \quad \Delta_{\mathbb{Q}(\omega)} = -3$$

where $\gamma := \frac{1+\sqrt{5}}{2}$ and $\omega = \zeta_3$.

Theorem 2.3. *Let $\theta^3 = hk^2$ for h, k square-free's.*

$$\mathcal{O}_{\mathbb{Q}(\theta)} = \begin{cases} \mathbb{Z} + \theta\mathbb{Z} + \frac{\theta^2}{k}\mathbb{Z} & , m \not\equiv \pm 1 \pmod{9} \\ \mathbb{Z} + \theta\mathbb{Z} + \frac{\theta^2 \pm \theta k + k^2}{3k}\mathbb{Z} & , m \equiv \pm 1 \pmod{9} \end{cases}$$

Corollary 2.4. *If θ^3 is a square free integer, then*

$$\mathcal{O}_{\mathbb{Q}(\theta)} = \mathbb{Z}[\theta].$$

2.2 Integral basis

Theorem 2.5. *Let $\alpha \in K$. $\text{Tr}_K(\alpha) \in \mathbb{Z}$ if $\alpha \in \mathcal{O}_K$. $N_K(\alpha) \in \mathbb{Z}$ if and only if $\alpha \in \mathcal{O}_K$.*

Theorem 2.6. *Let $\{\omega_1, \dots, \omega_n\}$ be a basis of K over \mathbb{Q} . If $\Delta(\omega_1, \dots, \omega_n)$ is square-free, then $\{\omega_1, \dots, \omega_n\}$ is an integral basis.*

Theorem 2.7. *Let $\{\omega_1, \dots, \omega_n\}$ be a basis of K over \mathbb{Q} consisting of algebraic integers. If $p^2 \mid \Delta$ and it is not an integral basis, then there is a nonzero algebraic integer of the form*

$$\frac{1}{p} \sum_{i=1}^n \lambda_i \omega_i.$$

2.3 Fractional ideals

Theorem 2.8. *Every fractional ideal of K is a free \mathbb{Z} -module with rank $[K : \mathbb{Q}]$.*

Proof. This theorem holds because K/\mathbb{Q} is separable and \mathbb{Z} is a PID.

□

2.4 Frobenius element

Consider an abelian extension L/K . Let \mathfrak{p} be a prime in \mathcal{O}_K . Since L/K is Galois, the followings do not depend on the choice of \mathfrak{P} over \mathfrak{p} .

Lemma 2.9. *The following sequence of abelian groups is exact:*

$$0 \longrightarrow I(\mathfrak{P}|\mathfrak{p}) \longrightarrow D(\mathfrak{P}|\mathfrak{p}) \longrightarrow \text{Gal}(k(\mathfrak{P})/k(\mathfrak{p})) \longrightarrow 0,$$

where $k(\mathfrak{P}) := \mathcal{O}_L/\mathfrak{P}$ and $k(\mathfrak{p}) := \mathcal{O}_K/\mathfrak{p}$ are residue fields.

The Frobenius element is defined as an element of $D(\mathfrak{P}|\mathfrak{p})/I(\mathfrak{P}|\mathfrak{p}) \cong \text{Gal}(k(\mathfrak{P})/k(\mathfrak{p}))$, which is a cyclic group.

Definition 2.1. For an unramified prime $\mathfrak{p} \subset \mathcal{O}_K$ so that $I(\mathfrak{P}|\mathfrak{p})$ is trivial, the Frobenius element $\phi(\mathfrak{P}|\mathfrak{p}) \in \text{Gal}(L/K)$ is defined by

$$\phi_{\mathfrak{P}|\mathfrak{p}}(\mathfrak{P}) = \mathfrak{P}, \quad \text{and} \quad \phi_{\mathfrak{P}|\mathfrak{p}}(x) \equiv x^{|\mathcal{O}_K/\mathfrak{p}|} \pmod{\mathfrak{P}} \quad \text{for } x \in \mathcal{O}_L.$$

The first condition is equivalent to $\phi_{\mathfrak{P}|\mathfrak{p}} \in D(\mathfrak{P}|\mathfrak{p})$. In fact, the Frobenius element is in fact a generator of the cyclic group $D(\mathfrak{P}|\mathfrak{p}) \cong \text{Gal}(k(\mathfrak{P})/k(\mathfrak{p}))$ by the Galois theory of finite fields.

Remark. Fermat's little theorem states

$$\phi_{\mathfrak{P}|\mathfrak{p}}(x) \equiv x \pmod{\mathfrak{p}}, \text{ for } x \in \mathcal{O}_K,$$

which means $\phi_{\mathfrak{P}|\mathfrak{p}}$ fixes the field $\mathcal{O}_K/\mathfrak{p}$ so that $\phi_{\mathfrak{P}|\mathfrak{p}} \in \text{Gal}(k(\mathfrak{P})/k(\mathfrak{p}))$.

2.5 Quadratic Dirichlet character

Let $K = \mathbb{Q}(\sqrt{D})$ be a quadratic field with discriminant D and $L = \mathbb{Q}(\zeta_D)$ be the cyclotomic field for $\zeta_D = e^{\frac{2\pi i}{D}}$.

$$\begin{array}{ccc} D(\mathfrak{P}/p) \subset \text{Gal}(L/\mathbb{Q}) & \cong & (\mathbb{Z}/D\mathbb{Z})^\times & L = \mathbb{Q}(\zeta_D) \\ & \downarrow q & \downarrow \chi_K = (\frac{D}{\cdot}) & \\ D(\mathfrak{p}/p) \subset \text{Gal}(K/\mathbb{Q}) & \cong & \{\pm 1\} & K = \mathbb{Q}(\sqrt{D}). \end{array}$$

For $p \nmid D$ so that p is unramified, let $\sigma_p := (\zeta_D \mapsto \zeta_D^p) \in \text{Gal}(L/\mathbb{Q})$. Then, what is $\sigma_p|_K$ in $\text{Gal}(K/\mathbb{Q})$. In other words, for $\sigma_p(\zeta_D) = \zeta_D^p$ which is true: $\sigma_p(\sqrt{D}) = \pm\sqrt{D}$?

Note that σ satisfies the condition to be the Frobenius element: $\sigma_p = \phi_{\mathfrak{P}|p}$. Therefore, $q(\phi_{\mathfrak{P}|p}) = \phi_{\mathfrak{p}|p} = \sigma_p|_K$ is also a Frobenius element. There are only two cases:

- (1) If $f = |D(\mathfrak{p}/p)| = 1$, then $\sigma|_K$ is the identity, so $\chi_K(p) = 1$
- (2) If $f = |D(\mathfrak{p}/p)| = 2$, then $\sigma|_K$ is not trivial, so $\chi_K(p) = -1$

Artin reciprocity: $(\mathbb{Z}/D\mathbb{Z})^\times$ is extended to I_K^S .

3 Diophantine equations

3.1 Quadratic equation on a plane

Ellipse is reduced by finitely many computations.

Especially for hyperbola, here is a strategy to use infinite descent.

- (1) Let midpoint to be origin.
- (2) Find the subgroup of $SL_2(\mathbb{Z})$ preserving the image of hyperbola (which would be isomorphic to \mathbb{Z}).
- (3) Find an impossible region.
- (4) Assume a solution and reduce it to the either impossible region or the ground solution.

Example 3.1 (Pell's equation). Consider

$$x^2 - 2y^2 = 1.$$

A generator of hyperbola generating group is $g = \begin{pmatrix} 3 & 4 \\ 2 & 3 \end{pmatrix}$. It has a ground solution $(1, 0)$ and impossible region $1 < x < 3$. If (a, b) is a solution with $a > 0$, then we can find n such that $g^n(a, b)$ is in the region $[1, 3]$. The possible case is $g^n(a, b) = (1, 0)$.

Example 3.2 (IMO 1988, the last problem). Consider a family of equations

$$x^2 + y^2 - kxy - k = 0.$$

By the vieta jumping, a generator is $g : (a, b) \mapsto (b, kb - a)$. It has an impossible region $xy < 0 : x^2 + y^2 - kxy - k \geq x^2 + y^2 > 0$. If (a, b) is a solution with $a > b$, then we can find n such that $g^n(a, b)$ is in the region $xy \leq 0$. Only possible case is $g^n(a, b) = (\sqrt{k}, 0)$ or $g^n(a, b) = (0, -\sqrt{k})$. In other words, the equation has a solution iff k is a perfect square.

3.2 The Mordell equations

(The reciprocity laws let us learn not only which prime splits, but also which prime factors a given polynomial has.)

$$y^2 = x^3 + k$$

There are two strategies for the Mordell equations:

- $x^2 - 2x + 4$ has a prime factor of the form $4k + 3$
- $x^3 = N(y - a)$ for some a .

First case: $k = 7, -5, -6, 45, 6, 46, -24, -3, -9, -12$.

Example 3.3. Solve $y^2 = x^3 + 7$.

Proof. Taking mod 8, x is odd and y is even. Consider

$$y^2 + 1 = (x + 2)(x^2 - 2x + 4).$$

Since

$$x^2 - 2x + 4 = (x - 1)^2 + 3,$$

there is a prime $p \equiv 3 \pmod{4}$ that divides the right hand side. Taking mod p , we have

$$y^2 \equiv -1 \pmod{p},$$

which is impossible. Therefore, the equation has no solutions. \square

Example 3.4. Solve $y^2 = x^3 - 2$.

Proof. Taking mod 8, x and y are odd. Consider a ring of algebraic integers $\mathbb{Z}[\sqrt{-2}]$. We have

$$N(y - \sqrt{-2}) = (y - \sqrt{-2})(y + \sqrt{-2}) = x^3.$$

For a common divisor δ of $y \pm \sqrt{-2}$, we have

$$N(\delta) \mid N((y - \sqrt{-2}) - (y + \sqrt{-2})) = N(2\sqrt{-2}) = |(2\sqrt{-2})(-2\sqrt{-2})| = 8.$$

On the other hand,

$$N(\delta) \mid x^3 \equiv 1 \pmod{2},$$

so $N(\delta) = 1$ and δ is a unit. Thus, $y \pm \sqrt{-2}$ are relatively prime. Since the units in $\mathbb{Z}[\sqrt{-2}]$ are ± 1 , which are cubes, $y \pm \sqrt{-2}$ are cubics in $\mathbb{Z}[\sqrt{-2}]$.

Let

$$y + \sqrt{-2} = (a + b\sqrt{-2})^3 = a(a^2 - 6b^2) + b(3a^2 - 2b^2)\sqrt{-2},$$

so that $1 = b(3a^2 - 2b^2)$. We can conclude $b = \pm 1$. The possible solutions are $(x, y) = (3, \pm 5)$, which are in fact solutions. \square

4 The local-global principle

4.1 The local fields

Let $f \in \mathbb{Z}[x]$.

Does $f = 0$ have a solution in \mathbb{Z} ?

Does $f = 0$ have a solution in $\mathbb{Z}/(p^n)$ for all n ?

Does $f = 0$ have a solution in \mathbb{Z}_p ?

In the first place, here is the algebraic definition.

Definition 4.1. Let $p \in \mathbb{Z}$ be a prime. The ring of the p -adic integers \mathbb{Z}_p is defined by the inverse limit:

$$\mathbb{Z}_p := \varprojlim_{n \in \mathbb{N}} \mathbb{F}_{p^n} \longrightarrow \cdots \longrightarrow \mathbb{Z}/(p^3) \longrightarrow \mathbb{Z}/(p^2) \longrightarrow \mathbb{F}_p.$$

Definition 4.2. $\mathbb{Q}_p = \text{Frac } \mathbb{Z}_p$.

Secondly, here is the analytic definition.

Definition 4.3. Let $p \in \mathbb{Z}$ be a prime. Define a absolute value $|\cdot|_p$ on \mathbb{Q} by $|p^m a|_p = \frac{1}{p^m}$. The local field \mathbb{Q}_p is defined by the completion of \mathbb{Q} with respect to $|\cdot|_p$.

Definition 4.4. $\mathbb{Z}_p := \{x \in \mathbb{Q}_p : |x|_p \leq 1\}$.

Example 4.1. Observe

$$\begin{aligned} 3^{-1} &\equiv 2_5 \pmod{5} \\ &\equiv 32_5 \pmod{5^2} \\ &\equiv 132_5 \pmod{5^3} \\ &\equiv 1313132_5 \pmod{5^7} \cdots \end{aligned}$$

Therefore, we can write

$$3^{-1} = \overline{132}_5 = 2 + 3p + p^2 + 3p^3 + p^4 + \cdots$$

for $p = 5$. Since there is no negative power of 5, 3^{-1} is a p -adic integer for $p = 5$.

Example 4.2.

$$\begin{aligned} 7 &\equiv 1_3^2 \pmod{3} \\ &\equiv 111_3^2 \pmod{3^3} \\ &\equiv 20111_3^2 \pmod{3^5} \\ &\equiv 120020111_3^2 \pmod{3^9} \cdots \end{aligned}$$

Therefore, we can write

$$\sqrt{7} = \cdots 120020111_3 = 1 + p + p^2 + 2p^4 + 2p^7 + p^8 + \cdots$$

for $p = 3$. Since there is no negative power of 3, $\sqrt{7}$ is a p -adic integer for $p = 3$.

There are some pathological and interesting phenomena in local fields. Actually note that the values of $|\cdot|_p$ are totally disconnected.

Theorem 4.1. *The absolute value $|\cdot|_p$ is nonarchimedean: it satisfies $|x + y|_p \leq \max\{|x|_p, |y|_p\}$.*

Proof. Trivial. □

Theorem 4.2. *Every triangle in \mathbb{Q}_p is isosceles.*

Theorem 4.3. *\mathbb{Z}_p is a discrete valuation ring: it is local PID.*

Proof. asdf □

Theorem 4.4. *\mathbb{Z}_p is open and compact. Hence \mathbb{Q}_p is locally compact Hausdorff.*

Proof. \mathbb{Z}_p is open clearly. Let us show limit point compactness. Let $A \subset \mathbb{Z}_p$ be infinite. Since \mathbb{Z}_p is a finite union of cosets $p\mathbb{Z}_p$, there is α_0 such that $A \cap (\alpha_0 + p\mathbb{Z}_p)$ is infinite. Inductively, since

$$\alpha_n + p^{n+1}\mathbb{Z}_p = \bigcup_{1 \leq x < p} (\alpha_n + xp^{n+1} + p^{n+2}\mathbb{Z}_p),$$

we can choose α_{n+1} such that $\alpha_n \equiv \alpha_{n+1} \pmod{p^{n+1}}$ and $A \cap (\alpha_{n+1} + p^{n+2}\mathbb{Z}_p)$ is infinite. The sequence $\{\alpha_n\}$ is Cauchy, and the limit is clearly in \mathbb{Z}_p . □

4.2 Hensel's lemma

Theorem 4.5 (Hensel's lemma). *Let $f \in \mathbb{Z}_p[x]$. If f has a simple solution in \mathbb{F}_p , then f has a solution in \mathbb{Z}_p .*

Proof. asdf □

Remark. Hensel's lemma says: for X a scheme over \mathbb{Z}_p , X is smooth iff $X(\mathbb{Z}_p) \twoheadrightarrow X(\mathbb{F}_p) \dots ???$

Example 4.3. $f(x) = x^p - x$ is factorized linearly in $\mathbb{Z}_p[x]$.

4.3 Sums of two squares

Theorem 4.6 (Euler). *A positive integer m can be written as a sum of two squares if and only if $v_p(m)$ is even for all primes $p \equiv 3 \pmod{4}$.*

Lemma 4.7. *Let p be a prime with $p \equiv 1 \pmod{4}$. Every p -adic integer is a sum of two squares of p -adic integers.*

5 Algebra problems

Linear algebra

- (1) Show that normal nilpotent matrix equals zero.
- (2) Show that two matrices AB and BA have same nonzero eigenvalues whose both multiplicities are coincide blabla...
- (3) Show that if A is a square matrix whose characteristic polynomial is minimal then a matrix commuting A is a polynomial in A .
- (4) Show that if two by two integer matrix is a root of unity then its order divides 12.

Groups

- (1) Show that a finite symmetric group has two generators.
- (2) Show that a group of order $2p$ for a prime p has exactly two isomorphic types.
- (3) Show that a group G is abelian if $|G| = p^2$ for a prime p .
- (4) Show that a group G is abelian if it has a surjective cube map.
- (5) Let G be a finite group of order n and p the smallest prime divisor of n . Show that a subgroup of G of index p is normal in G .
- (6) Find all n such that $(\mathbb{Z}/n\mathbb{Z})^\times$ is cyclic.
- (7) Show that a nontrivial normalizer of a p -group meets its center out of identity.
- (8) Show that a proper subgroup of a finite p -group is a proper subgroup of its normalizer. In particular, every finite p -group is nilpotent.
- (9) Show that a finite group G satisfying $\sum_{g \in G} \text{ord}(g) \leq 2n$ is abelian.
- (10) Show that the order of a group with trivial automorphism group is either 1 or 2.
- (11) Find all homomorphic images of A_4 up to isomorphism.
- (12) Show that in a group of order 105 is a single Sylow p -subgroup for $p = 5, 7$.
- (13) Show that the number of Sylow p -subgroups of $\text{SL}_3(\mathbb{F}_p)$ is $(p^2 + p + 1)(p + 1)$.

Rings

- (1) Show that a finite integral domain is a field.
- (2) Show that every ring of order p^2 for a prime p is commutative.
- (3) Show that a semiring with multiplicative identity and cancellative addition has commutative addition.
- (4) Show that the complement of a saturated monoid in a commutative ring is a union of prime ideals.

Galois theory

- (1) Show that the Galois group of a quintic over \mathbb{Q} having exactly three real roots is isomorphic to S_5 .
