1.1 Closed operators

Theorem 1.1. Let A, B be closed operators between Banach spaces. Then, A + B is closed iff

$$||Ax|| + ||Bx|| \lesssim ||(A+B)x|| + ||x||,$$

i.e. A and B are A + B-bounded.

Theorem 1.2. Let A be a closed, and B be a closable operator between Banach spaces with $D(A) \subset D(B)$. Then, A + B is closed if

$$||Bx|| \lesssim ||Ax|| + ||x||,$$

i.e. B is A-bounded. Hmmmmmmm

Any idea to prove?

Proposition 1.3. For $T \in D_{cl}(X, Y)$,

T is unbounded \iff T is not everywhere defined.

1.2 Decomposition of spectrum

Note that decomposition of spectrum is usually for closed operators.

- (1) For closed operators, we do not have to consider cores.
- (2) We will not distinguish everywhere defined operators and densely defined operators.
- (3) We will not care whether its domain for unbounded densely defined operators. If closed, then unboundedness is equivalent to everywhere defined.

Let X = Y in order to see L(X, Y) as a ring. Let $L(X) \subset D(X) \subset B(X)$ be spaces of linear operators, densely defined operators, densely define bounded operators respectively. For $T \in L(X)$,

$$\lambda \begin{cases} \text{is in } \rho(T) \\ \text{is in } \sigma_c(T) \\ \text{is in } \sigma_r(T) \\ \text{is in } \sigma_p(T) \end{cases} \quad \text{iff} \quad R_{\lambda}(T) \begin{cases} \in B(X) \\ \in D(X) \setminus B(X) \\ \in L(X) \setminus D(X) \\ \text{does not exist in } L(X) \end{cases}.$$

Discrete spectrum consists of scalars having finite dimensional eigenspace and is isolated from any other elements in spectrum.

1.3 Adjoint

For Banach spaces, we have

$$adj: D(X,Y) \to cl(Y^*,X^*)$$

that is not injetcive. (I don't know it's surjective)

For reflexive Y, we have

$$\operatorname{adj}: D_{cl}(X,Y) \to D_{cl}(Y^*,X^*)$$

that is inj? surj?

For reflexive X, we have

$$adj: D_{closable}(X) \rightarrow D_{cl}(X^*).$$

Theorem 1.4. The adjoint $B_{cl}(H) \xrightarrow{\sim} B_{cl}(H)$ can be extended to $D_{cl}(H) \xrightarrow{\sim} D_{cl}(H)$.

Theorem 1.5. For $T \in D_{cl}(H)$, $H = \ker T \oplus \overline{\operatorname{im} T^*}$.

The space D_{cl} is optimized when we think adjoints for reflexive spaces. unitarily equivalence can defined for $T_1 \in L(H_1)$ and $T_2 \in L(H_2)$.

2 Vector calculus on spherical coordinates

$$\begin{split} V &= & (V_r, V_\theta, V_\phi) \\ &= & V_r \qquad \widehat{r} \qquad + \qquad V_\theta \qquad \widehat{\theta} \qquad + \qquad V_\phi \qquad \widehat{\phi} \qquad \text{(normalized coords)} \\ &= & V_r \qquad \frac{\partial}{\partial r} \qquad + \qquad \frac{1}{r} \ V_\theta \qquad \frac{\partial}{\partial \theta} \qquad + \qquad \frac{1}{r \sin \theta} \ V_\phi \qquad \frac{\partial}{\partial \phi} \qquad (\Gamma(TM)) \\ &= & V_r \qquad dr \qquad + \qquad r \ V_\theta \qquad d\theta \qquad + \qquad r \sin \theta \ V_\phi \qquad d\phi \qquad (\Omega^1(M)) \\ &= & r^2 \sin \theta \ V_r \qquad d\theta \wedge d\phi \qquad + \qquad r \sin \theta \ V_\theta \qquad d\phi \wedge dr \qquad + \qquad r \ V_\phi \qquad dr \wedge d\theta \qquad (\Omega^2(M)). \\ &\nabla \cdot V = \frac{1}{r^2 \sin \theta} \left[\frac{\partial}{\partial r} \left(r^2 \sin \theta \ V_r \right) + \frac{\partial}{\partial \theta} \left(r \sin \theta \ V_\theta \right) + \frac{\partial}{\partial \phi} \left(r \ V_\phi \right) \right] \end{split}$$

3 Statements in functional analysis and general topology

Function analysis:

- Every seperable Banach space is linearly isomorphic and homeomorphic. But there are two non-isomorphic Banach spaces.
- open mapping theorem -; continuous embedding is really an embedding.
- $D(\Omega)$ is defined by a *countable stict* inductive limit of $D_K(\Omega)$, $K \subset \Omega$ compact. Hence it is not metrizable by the Baire category theorem. (Here strict means that whenever $\alpha < \beta$ the induced topology by \mathcal{T}_{β} coincides with \mathcal{T}_{α})
- A net $(\phi_d)_d$ in $D(\Omega)$ converges if and only if there is a compact K such that $\phi_d \in D_K(\Omega)$ for all d and ϕ_d converges uniformly.
- Th integration with a locally integrable function is a distribution. This kind of distribution is called regular. The nonregular distribution such as δ is called singular.
- D' is equipped with the weak* topology.
- $\frac{\partial}{\partial x}$: $D' \to D'$ is continuous. They commute (Schwarz theorem holds).
- $D \to S \to L^p$ are continuous (immersion) but not imply closed subspaces (embedding).

General topology:

• $H \subset \mathbb{C}$ and $H \subset \widehat{\mathbb{C}}$ have distinct Cauchy structures which give a same topology. In addition, the latter is precompact while the former is not.

4 Algebraic closure

Theorem 4.1. Every field has an algebraic closure.

Proof. Let F be a field.

Step 1: Construct an algebraically closed field containing F.. Let S be a set of irreducibles or nonconstants in F[x].(anyone is fine) Define $R := F[\{x_p\}_{p \in S}]$. Let I be an ideal in R generated by $p(x_p)$ as p runs through all S. It has a maximal ideal $\mathfrak{m} \supset I$.

Define $K_1 := R/\mathfrak{m}$. Every nonconstant $f \in F[x]$ has a root in K_1 . (In fact, this K_1 is already algebraically closed, but it's hard to prove.) Construct K_2, \cdots such that every nonconstant $f \in K_n[x]$ has a root in K_{n+1} . Define $K = \lim_{\longrightarrow} K_n$. Then, K is algebraically closed.

Step 2: Construct the algebraic closure of F.. Let \overline{F} be the set of all algebraic elements of K over F. Then, this is the algebraic closure.

5 Space curve theory

Definition 5.1. Let α be a curve.

$$\mathbf{T} := \frac{\alpha'}{\|\alpha'\|}, \quad \mathbf{N} := \frac{\mathbf{T}'}{\|\mathbf{T}'\|}, \quad \mathbf{B} := \mathbf{T} \times \mathbf{N}.$$

Proposition 5.1. T', B', N are collinear.

Definition 5.2.

$$s(t) := \int_0^t \|\alpha'\|, \quad \kappa := \frac{d\mathbf{T}}{ds} \cdot \mathbf{N}, \quad \tau := -\frac{d\mathbf{B}}{ds} \cdot \mathbf{N}.$$

Theorem 5.2 (Frenet-Serret formula). Let α be a unit speed curve.

$$\begin{pmatrix} \mathbf{T'} \\ \mathbf{N'} \\ \mathbf{B'} \end{pmatrix} = \begin{pmatrix} 0 & \kappa & 0 \\ -\kappa & 0 & \tau \\ 0 & -\tau & 0 \end{pmatrix} \begin{pmatrix} \mathbf{T} \\ \mathbf{N} \\ \mathbf{B} \end{pmatrix}.$$

Theorem 5.3. Let α be a unit speed curve.

$$\alpha' = \mathbf{T}$$

$$\alpha'' = \kappa \mathbf{N}$$

$$\alpha''' = -\kappa^2 \mathbf{T} + \kappa' \mathbf{N} + \kappa \tau \mathbf{B}$$

$$\kappa = \|\alpha''\|, \quad \tau \frac{[\alpha' \alpha'' \alpha''']}{\kappa^2}.$$

Theorem 5.4. Let α be a curve.

$$\alpha' = s'\mathbf{T}$$

$$\alpha'' = s''\mathbf{T} + s'^{2}\kappa\mathbf{N}$$

$$\alpha''' = (s''' - s'^{3}\kappa^{2})\mathbf{T} + (3s's''\kappa + s'^{2}\kappa')\mathbf{N} + s'^{3}\kappa\tau\mathbf{B}$$

$$\kappa = \frac{\|\alpha' \times \alpha''\|}{\|\alpha'\|^{3}}, \quad \tau = \frac{[\alpha'\alpha''\alpha''']}{\|\alpha' \times \alpha''\|}.$$

Problem solving strategy:

• Represent α and its derivatives over the Frenet basis.

•

Uniqueness: The Frene-Serret formula is an ODE for the vector (of vectors) $(\mathbf{T}, \mathbf{N}, \mathbf{B})$. After showing this equation preserves orthonormality, obtain α by integratin \mathbf{T} . The skew-symmetry implies that $\|\mathbf{T}\|^2 + \|\mathbf{N}\|^2 + \|\mathbf{B}\|^2$ is constant.

6 Algebraic integer

6.1 Quadratic integer

Theorem 6.1. Every quadratic field is of the form $\mathbb{Q}(\sqrt{d})$ for a square-free d.

Theorem 6.2. Let d be a square-free.

$$\mathcal{O}_{\mathbb{Q}(\sqrt{d})} = \begin{cases} \mathbb{Z} + \sqrt{d}\mathbb{Z} & , d \equiv 2, 3 \pmod{4} \\ \mathbb{Z} + \frac{1 + \sqrt{d}}{2}\mathbb{Z} & , d \equiv 1 \pmod{4} \end{cases}$$

$$\Delta_{\mathbb{Q}(\sqrt{d})} = \begin{cases} 4d & , d \equiv 2, 3 \pmod{4} \\ d & , d \equiv 1 \pmod{4} \end{cases}$$

Theorem 6.3. Let $\theta^3 = hk^2$ for h, k square-free's.

$$\mathcal{O}_{\mathbb{Q}(\theta)} = \begin{cases} \mathbb{Z} + \sqrt[3]{hk^2}\mathbb{Z} + \sqrt[3]{h^2k}\mathbb{Z} &, m \not\equiv \pm 1 \pmod{9} \\ \mathbb{Z} + \theta\mathbb{Z} + \frac{\theta^2 \pm \theta k + k^2}{3k}\mathbb{Z} &, m \equiv \pm 1 \pmod{9} \end{cases}$$

6.2 Integral basis

Theorem 6.4. Let $\alpha \in K$. $Tr_K(\alpha) \in \mathbb{Z}$ if $\alpha \in \mathcal{O}_K$. $N_K(\alpha) \in \mathbb{Z}$ if and only if $\alpha \in \mathcal{O}_K$.

Theorem 6.5. Let $\{\omega_1, \dots, \omega_n\}$ be a basis of K over \mathbb{Q} . If $\Delta(\omega_1, \dots, \omega_n)$ is square-free, then $\{\omega_1, \dots, \omega_n\}$ is an integral basis.

Theorem 6.6. Let $\{\omega_1, \dots, \omega_n\}$ be a basis of K over \mathbb{Q} consisting of algebraic integers. If $p^2 \mid \Delta$ and it is not an integral basis, then there is a nonzero algebraic integer of the form

$$\frac{1}{p} \sum_{i=1}^{n} \lambda_i \omega_i.$$

6.3 Fractional ideals

Theorem 6.7. Every fractional ideal of K is a free \mathbb{Z} -module with rank $[K, \mathbb{Q}]$.

Proof. This theorem holds because K/\mathbb{Q} is separable and \mathbb{Z} is a PID.

7 Diophantine equations

The reciprocity laws let us know not only what primes split, but also what prime factors a polynomial has.

7.1 The Mordell equations

$$y^2 = x^3 + k$$

There are two strategies for the Mordell equations:

- $x^2 2x + 4$ has a prime factor of the form 4k + 3
- $x^3 = N(y a)$ for some a.

First case: k = 7, -5, -6, 45, 6, 46, -24, -3, -9, -12.

Example 7.1. Solve $y^2 = x^3 + 7$.

Proof. Taking mod 8, x is odd and y is even. Consider

$$y^2 + 1 = (x+2)(x^2 - 2x + 4).$$

Since

$$x^2 - 2x + 4 = (x - 1)^2 + 3$$
,

there is a prime $p \equiv 3 \pmod{4}$ that divides the right hand side. Taking mod p, we have

$$y^2 \equiv -1 \pmod{p},$$

which is impossible. Therefore, the equation has no solutions.

Example 7.2. Solve $y^2 = x^3 - 2$.

Proof. Taking mod 8, x and y are odd. Consider a ring of algebraic integers $\mathbb{Z}[\sqrt{-2}]$. We have

$$N(y - \sqrt{-2}) = (y - \sqrt{-2})(y + \sqrt{-2}) = x^3.$$

For a common divisor δ of $y \pm \sqrt{-2}$, we have

$$N(\delta) \mid N((y - \sqrt{-2}) - (y + \sqrt{-2})) = N(2\sqrt{-2}) = |(2\sqrt{-2})(-2\sqrt{-2})| = 8.$$

On the other hand,

$$N(\delta) \mid x^3 \equiv 1 \pmod{2}$$
,

so $N(\delta) = 1$ and δ is a unit. Thus, $y \pm \sqrt{-2}$ are relatively prime. Since the units in $\mathbb{Z}[\sqrt{-2}]$ are ± 1 , which are cubes, $y \pm \sqrt{-2}$ are cubics in $\mathbb{Z}[\sqrt{-2}]$.

Let

$$y + \sqrt{-2} = (a + b\sqrt{-2})^3 = a(a^2 - 6b^2) + b(3a^2 - 2b^2)\sqrt{-2}$$

so that $1 = b(3a^2 - 2b^2)$. We can conclude $b = \pm 1$. The possible solutions are $(x, y) = (3, \pm 5)$, which are in fact solutions.

8 The local-global principle

8.1 The local fields

Let $f \in \mathbb{Z}[x]$.

Does
$$f = 0$$
 have a solution in \mathbb{Z} ?

Does $f = 0$ have a solution in $\mathbb{Z}/(p^n)$ for all n ?

Does $f = 0$ have a solution in \mathbb{Z}_p ?

In the first place, here is the algebraic definition.

Definition 8.1. Let $p \in \mathbb{Z}$ be a prime. The ring of the p-adic integers \mathbb{Z}_p is defined by the inverse limit:

$$\mathbb{Z}_p := \lim_{\substack{\longleftarrow \\ n \in \mathbb{N}}} \mathbb{F}_{p^n} \longrightarrow \cdots \longrightarrow \mathbb{Z}/(p^3) \longrightarrow \mathbb{Z}/(p^2) \longrightarrow \mathbb{F}_p.$$

Definition 8.2. $\mathbb{Q}_p = \operatorname{Frac} \mathbb{Z}_p$.

Secondly, here is the analytic definition.

Definition 8.3. Let $p \in \mathbb{Z}$ be a prime. Define a absolute value $|\cdot|_p$ on \mathbb{Q} by $|p^m a|_p = \frac{1}{p^m}$. The local field \mathbb{Q}_p is defined by the completion of \mathbb{Q} with respect to $|\cdot|_p$.

Definition 8.4. $\mathbb{Z}_p := \{x \in \mathbb{Q}_p : |x|_p \leq 1\}.$

Example 8.1. Observe

$$3^{-1} \equiv 2_5 \pmod{5}$$
$$\equiv 32_5 \pmod{5^2}$$
$$\equiv 132_5 \pmod{5^3}$$
$$\equiv 1313132_5 \pmod{5}^7 \cdots$$

Therefore, we can write

$$3^{-1} = \overline{13}2_5 = 2 + 3p + p^2 + 3p^3 + p^4 + \cdots$$

for p=5. Since there is no negative power of 5, 3^{-1} is a p-adic integer for p=5.

Example 8.2.

$$7 \equiv 1_3^2 \pmod{3}$$
$$\equiv 111_3^2 \pmod{3^3}$$
$$\equiv 20111_3^2 \pmod{3^5}$$
$$\equiv 120020111_3^2 \pmod{3^9} \cdots$$

Therefore, we can write

$$\sqrt{7} = \cdots 120020111_3 = 1 + p + p^2 + 2p^4 + 2p^7 + p^8 + \cdots$$

for p=3. Since there is no negative power of 3, $\sqrt{7}$ is a p-adic integer for p=3.

There are some pathological and interesting phenomena in local fields. Actually note that the values of $|\cdot|_p$ are totally disconnected.

Theorem 8.3. The absolute value $|\cdot|_p$ is nonarchimedean: it satisfies $|x+y|_p \leq \max\{|x|_p,|y|_p\}$.

Proof. Trivial. \Box

Theorem 8.4. Every triangle in \mathbb{Q}_p is isosceles.

Theorem 8.5. \mathbb{Z}_p is a discrete valuation ring: it is local PID.

$$Proof.$$
 asdf

Theorem 8.6. \mathbb{Z}_p is open and compact. Hence \mathbb{Q}_p is locally compact Hausdorff.

Proof. \mathbb{Z}_p is open clearly. Let us show limit point compactness. Let $A \subset \mathbb{Z}_p$ be infinite. Since \mathbb{Z}_p is a finite union of cosets $p\mathbb{Z}_p$, there is α_0 such that $A \cap (\alpha_0 + p\mathbb{Z}_p)$ is infinite. Inductively, since

$$\alpha_n + p^{n+1} \mathbb{Z}_p = \bigcup_{1 \le x \le p} (\alpha_n + xp^{n+1} + p^{n+2} \mathbb{Z}_p),$$

we can choose α_{n+1} such that $\alpha_n \equiv \alpha_{n+1} \pmod{p^{n+1}}$ and $A \cap (\alpha_{n+1} + p^{n+2}\mathbb{Z}_p)$ is infinite. The sequence $\{\alpha_n\}$ is Cauchy, and the limit is clearly in \mathbb{Z}_p .

8.2 Hensel's lemma

Theorem 8.7 (Hensel's lemma). Let $f \in \mathbb{Z}_p[x]$. If f has a simple solution in \mathbb{F}_p , then f has a solution in \mathbb{Z}_p .

$$Proof.$$
 asdf

Remark. Hensel's lemma says: for X a scheme over \mathbb{Z}_p , X is smooth iff $X(\mathbb{Z}_p) \to X(\mathbb{F}_p)$???

Example 8.8. $f(x) = x^p - x$ is factorized linearly in $\mathbb{Z}_p[x]$.

8.3 Sums of two squares

Theorem 8.9 (Euler). A positive integer m can be written as a sum of two squares if and only if $v_p(m)$ is even for all primes $p \equiv 3 \pmod{4}$.

Lemma 8.10. Let p be a prime with $p \equiv 1 \pmod{4}$. Every p-adic integer is a sum of two squares of p-adic integers.

9 Ultrafilter

Theorem 9.1. Let \mathcal{U} be an ultrafilter on a set S and X be a compact space. For $f: S \to X$, the limit \mathcal{U} -lim f always exists.

Theorem 9.2. Let $X = \prod_{\alpha \in \mathcal{A}} X_{\alpha}$ be a product space of compact spaces X_{α} . A net $\{f_d\}_{d \in \mathcal{D}}$ on X has a convergent subnet.

Proof 1. Use Tychonoff. Compactness and net compactness are equivalent. \Box

Proof 2. It is a proof without Tychonoff. Let \mathcal{U} be a ultrafilter on a set \mathcal{D} contatining all $\uparrow d$. Define a directed set $\mathcal{E} = \{(d, U) \in \mathcal{D} \times \mathcal{U} : d \in U\}$ as $(d, U) \prec (d', U')$ for $U \supset U'$. Let $f : \mathcal{E} \to X$ be a net defined by $f_{(d,U)} = f_d$.

By the previous theorem, $\mathcal{U}\text{-}\lim \pi_{\alpha} f_d$ exsits for each α . Define $f \in X$ such that $\pi_{\alpha} f = \mathcal{U}\text{-}\lim \pi_{\alpha} f_d$. Let $G = \prod_{\alpha} G_{\alpha} \subset X$ be any open neighborhood of f where $G_{\alpha} = X_{\alpha}$ except finite. Then G_{α} is an open neighborhood of $\pi_{\alpha} f$ so that we have $U_{\alpha} := \{d : \pi_{\alpha} f_d \in G_{\alpha}\} \in \mathcal{U}$ by definition of convergence with ultrafilter.9 Since $U_{\alpha} = \mathcal{D}$ except finites, we can take an upper bound $U_0 \in \mathcal{U}$. Then, by taking any $d_0 \in U_0$, we have $f_{(d,U)} \in G$ for every $(d,U) \succ (d_0,U_0)$. This means $f = \lim_{\mathcal{E}} f_{(d,U)}$, so we can say $\lim_{\mathcal{E}} f_{(d,U)}$ exists.

10 Universal coefficient theorem

Lemma 10.1. Suppose we have a flat resolution

$$0 \longrightarrow P_1 \longrightarrow P_0 \longrightarrow A \longrightarrow 0.$$

Then, we have a exact sequence

$$\cdots \longrightarrow 0 \longrightarrow \operatorname{Tor}_{1}^{R}(A,B) \longrightarrow P_{1} \otimes B \longrightarrow P_{0} \otimes B \longrightarrow A \otimes B \longrightarrow 0.$$

Theorem 10.2. Let R be a PID. Let C_{\bullet} be a chain complex of flat R-modules and G be a R-module. Then, we have a short exact sequence

$$0 \longrightarrow H_n(C) \otimes G \longrightarrow H_n(C;G) \longrightarrow \operatorname{Tor}(H_{n-1}(C),G) \longrightarrow 0,$$

which splits, but not naturally.

Proof 1. We have a short exact sequence of chain complexes

$$0 \longrightarrow Z_{\bullet} \longrightarrow C_{\bullet} \longrightarrow B_{\bullet-1} \longrightarrow 0$$

where every morphism in Z_{\bullet} and B_{\bullet} are zero. Since modules in $B_{\bullet-1}$ are flat, we have a short exact sequence

$$0 \longrightarrow Z_{\bullet} \otimes G \longrightarrow C_{\bullet} \otimes G \longrightarrow B_{\bullet-1} \otimes G \longrightarrow 0$$

and the associated long exact sequence

$$\cdots \longrightarrow H_n(B;G) \longrightarrow H_n(Z;G) \longrightarrow H_n(C;G) \longrightarrow H_{n-1}(B;G) \longrightarrow H_{n-1}(Z;G) \longrightarrow \cdots$$

where the connecting homomomorphisms are of the form $(i_n: B_n \to Z_n) \otimes 1_G$ (It is better to think diagram chasing than a natural construction). Since morphisms in B and Z are zero (if it is not, then the short exact sequence of chain complexes are not exact, we have

$$\cdots \longrightarrow B_n \otimes G \longrightarrow Z_n \otimes G \longrightarrow H_n(C;G) \longrightarrow B_{n-1} \otimes G \longrightarrow Z_{n-1} \otimes G \longrightarrow \cdots$$

Since

$$0 \longrightarrow \operatorname{Tor}_{1}^{R}(H_{n},G) \longrightarrow B_{n} \otimes G \longrightarrow Z_{n} \otimes G \longrightarrow H_{n} \otimes G \longrightarrow 0$$

for all n, the exact sequence splits into short exact sequence by images

$$0 \longrightarrow H_n \otimes G \longrightarrow H_n(C;G) \longrightarrow \operatorname{Tor}_1^R(H_{n-1},G) \longrightarrow 0.$$

For splitting, \Box

Proof 2. Since R is PID, we can construct a flat resolution of G

$$0 \longrightarrow P_1 \longrightarrow P_0 \longrightarrow G \longrightarrow 0.$$

Since modules in C_{\bullet} are flat so that the tensor product functors are exact and $P_1 \to P_0$ and $P_0 \to G$ induce the chain maps, we have a short exact sequence of chain complexes

$$0 \longrightarrow C_{\bullet} \otimes P_1 \longrightarrow C_{\bullet} \otimes P_0 \longrightarrow C_{\bullet} \otimes G \longrightarrow 0.$$

Then, we have the associated long exact sequence

$$\cdots \longrightarrow H_n(C; P_1) \longrightarrow H_n(C; P_0) \longrightarrow H_n(C; G) \longrightarrow H_{n-1}(C; P_1) \longrightarrow H_{n-1}(C; P_0) \longrightarrow \cdots$$

Since flat tensor product functor commutes with homology funtor from chain complexes, we have

$$\cdots \longrightarrow H_n \otimes P_1 \longrightarrow H_n \otimes P_0 \longrightarrow H_n(C;G) \longrightarrow H_{n-1} \otimes P_1 \longrightarrow H_{n-1} \otimes P_0 \longrightarrow \cdots$$

Since

$$0 \longrightarrow \operatorname{Tor}_{1}^{R}(G, H_{n}) \longrightarrow H_{n} \otimes P_{1} \longrightarrow H_{n} \otimes P_{0} \longrightarrow H_{n} \otimes G \longrightarrow 0$$

for all n, the exact sequence splits into short exact sequence by images

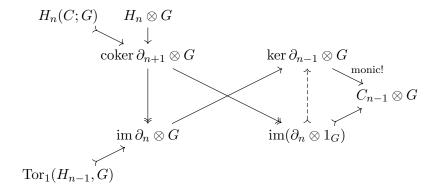

$$0 \longrightarrow H_n \otimes G \longrightarrow H_n(C;G) \longrightarrow \operatorname{Tor}_1^R(G,H_{n-1}) \longrightarrow 0.$$

Proof 3. (??) By tensoring G, we get the following diagram.

 $H_n \otimes G$ $H_{n-1} \otimes G$ $\operatorname{coker} \partial_{n+1} \otimes G \operatorname{ker} \partial_{n-1} \otimes G$ $\operatorname{im} \partial_n \otimes G$ $\operatorname{Tor}_1(H_{n-1}, G)$

Every aligned set of consecutive arrows indicates an exact sequence. Notice that epimorphisms and cokernals are preserved, but monomorphisms and kernels are not. Especially, $\operatorname{coker} \partial_{n+1} \otimes G = \operatorname{coker}(\partial_{n+1} \otimes 1_G)$ is important.

Consider the following diagram.

Since $\ker \partial_{n-1}$ is free,

If we show $\operatorname{im}(\partial_n \otimes 1_G) \to \ker \partial_{n-1} \otimes G$ is monic, then we can get

$$H_n(C; G) = \ker(\operatorname{coker} \partial_{n+1} \otimes G \to \operatorname{im}(\partial_n \otimes 1_G))$$

= $\ker(\operatorname{coker} \partial_{n+1} \otimes G \to \ker \partial_{n-1} \otimes G).$

11 Estimates

Theorem 11.1. The following series diverges:

$$\sum_{n=1}^{\infty} \frac{1}{n^{1+|\sin n|}}.$$

Proof. Let $A_k := [1, 2^k] \cap \{x : |\sin x| < \frac{1}{k}\}$. Divide the unit circle $\mathbb{R}/2\pi\mathbb{Z}$ by 7k uniform arcs. There are at least $2^k/7k$ integers that are not exceed 2^k and are in a same arc. Let S be the integers and x_0 be the smallest element. Since, $|x - x_0| \pmod{2\pi} < \frac{2\pi}{7k}$ for $x \in S$,

$$|\sin(x-x_0)| < |x-x_0| \pmod{2\pi} < \frac{2\pi}{7k} < \frac{1}{k}.$$

Also, $1 \le x - x_0 \le x \le 2^k$, $x - x_0 \in A_k$.

$$|A_k| \ge \frac{2^k}{7k}.$$

Therefore,

$$\begin{split} \sum_{n=1}^{\infty} \frac{1}{n^{1+|\sin n|}} &\geq \sum_{n \in A_N} \frac{1}{n^{1+|\sin n|}} \\ &\geq \sum_{k=1}^{N} (|A_k| - |A_{k-1}|) \frac{1}{2^{k+1}} \\ &= \sum_{k=1}^{N} \frac{|A_k|}{2^{k+1}} - \sum_{k=1}^{N-1} \frac{|A_k|}{2^{k+2}} \\ &= \frac{|A_N|}{2^{N+1}} + \sum_{k=1}^{N-1} \frac{|A_k|}{2^{k+2}} \\ &> \sum_{k=1}^{N} \frac{2^k}{2^{k+2}} \frac{1}{7^k} \\ &= \frac{1}{28} \sum_{k=1}^{N} \frac{1}{k} \\ &\to \infty. \end{split}$$

Theorem 11.2. If $|xf'(x)| \leq M$ and $\frac{1}{x} \int_0^x f(y) dy \to L$, then $f(x) \to L$ as $x \to \infty$.

Proof. Since

$$\left| f(x) - \frac{F(x) - F(a)}{x - a} \right| \le \frac{1}{x - a} \int_a^x |f(x) - f(y)| \, dy$$

$$= \frac{1}{x - a} \int_a^x (x - y)|f'(c)| \, dy$$

$$\le \frac{M}{x - a} \int_a^x \frac{x - y}{c} \, dy$$

$$\le M \frac{x - a}{a}$$

by the mean value theorem and

$$f(x) - L = \left[f(x) - \frac{F(x) - F(a)}{x - a} \right] + \frac{x}{x - a} \left[\frac{F(x)}{x} - L \right] + \frac{a}{x - a} \left[\frac{F(a)}{a} - L \right],$$

we have for any $\varepsilon > 0$

$$\limsup_{x \to \infty} |f(x) - L| \le \varepsilon$$

where a is defined by $\frac{x-a}{a} = \frac{\varepsilon}{M}$.

12 Action

Definition

- $G \curvearrowright X$
 - fcn $G \times X \to X$: compatibility, identity
 - hom ρ : G → Sym(X) or Aut(X)
 - funtor from G
 - nt) X is called G-set.
 - nt) ρ is called permutation repr.
 - * right action is a contravariant functor.
- $\operatorname{Stab}_G(x) = G_x$, $\operatorname{Orb}_G(x) = G.x$
 - Orbit-stabilizer theorem
 - pf) quotient with $-x: G \to X$.
 - * this is not the first isom.
 - * stabilizer is also called isotropy group.
- Faithfulness, Transitivity

Useful Actions

- * these actions are on P(G).
 - Left Multiplication

$$-\operatorname{Stab}(A) = AA^{-1}$$

eg)
$$G \curvearrowright G/H$$
, for $H \le G$
 $\ker \rho = \bigcap xHx^{-1} = \operatorname{Core}_G(H)$

• Conjugation

$$-\operatorname{Stab}(A) = N_G(A)$$

eg)
$$G \curvearrowright \{\{h\} : h \in H\}$$
, for $H \triangleleft G$

$$\ker \rho = C_G(H), \operatorname{im} \rho \subset \operatorname{Aut}(H)$$

eg)
$$G \curvearrowright \operatorname{Syl}_p$$

* conjugation is an isomorphism.

Sylow Theorem

•
$$\operatorname{Syl}_p \neq \emptyset$$

•
$$n_p = kp + 1 \mid [G : \overline{P}]$$

• $G \curvearrowright \operatorname{Syl}_p$ transitive pf) four actions by conjugation: $G \curvearrowright G, \quad \overline{P}, G, P \curvearrowright \operatorname{Orb}_G(\overline{P}).$

EXERCISES

13 Some problems

Problems I made:

- 1. Let f be C^2 with $f''(c) \neq 0$. Defined a function ξ such that $f(x) f(c) = f'(\xi(x))(x c)$ with $|\xi c| \leq |x c|$, show that $\xi'(c) = 1/2$.
- 2. Let f be a C^2 function such that f(0) = f(1) = 0. Show that $||f|| \leq \frac{1}{8} ||f''||$.
- 3. Show that a measurable subset of \mathbb{R} with positive measure contains an arbitrarily long subsequence of an arithmetic progression.
- 4. Show that there is no continuous bijection from $[0,1]^2 \setminus \{p\}$ to $[0,1]^2$.
- 1. Show that for a nonnegative sequence a_n if $\sum a_n$ diverges then $\sum \frac{a_n}{1+a_n}$ also diverges.
- 2. Show that if both limits of a function and its derivative exist at infinity then the former is 0.
- 3. Show that every real sequence has a monotonic subsequence that converges to the limit superior of the supersequence.
- 4. Show that if a decreasing nonnegative sequence a_n converges to 0 and satisfies $S_n \leq 1 + na_n$ then S_n is bounded by 1.
- 5. Show that the set of local minima of a convex function is connected.
- 6. Show that a smooth function such that for each x there is n having the nth derivative vanish is a polynomial.
- 7. Show that if a continuously differentiable f satisfies $f(x) \neq 0$ for f'(x) = 0, then in a bounded set there are only finite points at which f vanishes.
- 8. Let a function f be differentiable. For a < a' < b < b' show that there exist a < c < b and a' < c' < b' such that f(b) f(a) = f'(c)(b a) and f(b') f(a') = f'(c')(b' a').
- 9. Show that if xf'(x) is bounded and $x^{-1}\int_0^x f \to L$ then $f(x) \to L$ as $x \to \infty$.
- 10. Show that if a sequence of real functions $f_n: [0,1] \to [0,1]$ satisfies $|f(x)-f(y)| \le |x-y|$ whenever $|x-y| \ge \frac{1}{n}$, then the sequence has a uniformly convergent subsequence.
- 11. (Flett)
- 12. Let f be a differentiable function with f(0) = 0. Show that there is $c \in (0,1)$ such that cf(c) = (1-c)f'(c).
- 13. Find the value of $\lim_{n\to\infty} \frac{1}{n} \left(\sum_{k=1}^n \frac{1}{n} f\left(\frac{k}{n}\right) \int_0^1 f(x) \, dx \right)$.
- 14. Let f be a continuous function. Show that f(x)=c cannot have exactly two solutions for every c.

- 15. Show that a continuous function that takes on no value more than twice takes on some value exactly once.
- 16. Let f be a function that has the intermediate value property. Show that if the preimage of every singleton is closed, then f is continuous.
- 17. Show that if a holomorphic function has positive real parts on the open unit disk then $|f'(0)| < 2 \operatorname{Re} f(0)$.
- 18. Show that if at least one coefficient in the power series of a holomorphic function at each point is 0 then the function is a polynomial.
- 19. Show that if a holomorphic function on a domain containing the closed unit disk is injective on the unit circle then so is on the disk.
- 20. Show that for a holomorphic function f and every z_0 in the domain there are $z_1 \neq z_2$ such that $\frac{f(z_1) f(z_2)}{z_1 z_2} = f'(z_0)$.
- 21. For two linearly independent entire functions, show that one cannot dominate the other.
- 22. Show that uniform limit of injective holomorphic function is either constant or injective.
- 23. Suppose the set of points in a domain $U \subset \mathbb{C}$ at which a sequence of bounded holomorphic functions (f_n) converges has a limit point. Show that (f_n) compactly converges.
- 24. Show that normal nilpotent matrix equals zero.
- 25. Show that two matrices AB and BA have same nonzero eigenvalues whose both multiplicities are coincide blabla...
- 26. Show that if A is a square matrix whose characteristic polynomial is minimal then a matrix commuting A is a polynomial in A.
- 27. Show that if two by two integer matrix is a root of unity then its order divides 12.
- 28. Show that a finite symmetric group has two generators.
- 29. Show that a nontrivial normalizer of a p-group meets its center out of identity.
- 30. Show that a proper subgroup of a finite p-group is a proper subgroup of its normalizer. In particular, every finite p-group is nilpotent.
- 31. Show that the complement of a saturated monoid in a commutative ring is a union of prime ideals.
- 32. Show that the Galois group of a quintic over \mathbb{Q} having exactly three real roots is isomorphic to S_5 .
- 33. Show that if $A^{\circ} \in B$ and B is closed, then $(A \cup B)^{\circ} \subset B$.
- 34. Show that the tangent space of the unitary group at the identity is identified with the space of skew Hermitian matrices.
- 35. Prove the Jacobi formula for matrix.

- 36. Show that S^3 and T^2 are parallelizable.
- 37. Show that $\mathbb{R}P^n = S^n/Z_2$ is orientable if and only if n is odd.
