## 1 Vector calculus on spherical coordinates

$$V = (V_r, V_{\theta}, V_{\phi})$$

$$= V_r \qquad \hat{r} \qquad + \qquad V_{\theta} \qquad \hat{\theta} \qquad + \qquad V_{\phi} \qquad \hat{\phi} \qquad \text{(normalized coords)}$$

$$= V_r \qquad \frac{\partial}{\partial r} \qquad + \qquad \frac{1}{r} V_{\theta} \qquad \frac{\partial}{\partial \theta} \qquad + \qquad \frac{1}{r \sin \theta} V_{\phi} \qquad \frac{\partial}{\partial \phi} \qquad (\Gamma(TM))$$

$$= V_r \qquad dr \qquad + \qquad r V_{\theta} \qquad d\theta \qquad + \qquad r \sin \theta V_{\phi} \qquad d\phi \qquad (\Omega^1(M))$$

$$= r^2 \sin \theta V_r \qquad d\theta \wedge d\phi \qquad + \qquad r \sin \theta V_{\theta} \qquad d\phi \wedge dr \qquad + \qquad r V_{\phi} \qquad dr \wedge d\theta \qquad (\Omega^2(M)).$$

$$\nabla \cdot V = \frac{1}{r^2 \sin \theta} \left[ \frac{\partial}{\partial r} \left( r^2 \sin \theta \ V_r \right) + \frac{\partial}{\partial \theta} \left( r \sin \theta \ V_{\theta} \right) + \frac{\partial}{\partial \phi} \left( r \ V_{\phi} \right) \right]$$

# 2 Statements in functional analysis and general topology

#### Function analysis:

- Every seperable Banach space is linearly isomorphic and homeomorphic. But there are two non-isomorphic Banach spaces.
- open mapping theorem -i, continuous embedding is really an embedding.
- $D(\Omega)$  is defined by a countable stict inductive limit of  $D_K(\Omega)$ ,  $K \subset \Omega$  compact. Hence it is not metrizable by the Baire category theorem. (Here strict means that whenever  $\alpha < \beta$  the induced topology by  $\mathcal{T}_{\beta}$  coincides with  $\mathcal{T}_{\alpha}$ )
- A net  $(\phi_d)_d$  in  $D(\Omega)$  converges if and only if there is a compact K such that  $\phi_d \in D_K(\Omega)$  for all d and  $\phi_d$  converges uniformly.
- Th integration with a locally integrable function is a distribution. This kind of distribution is called regular. The nonregular distribution such as  $\delta$  is called singular.
- D' is equipped with the weak\* topology.
- $\frac{\partial}{\partial x}$ :  $D' \to D'$  is continuous. They commute (Schwarz theorem holds).
- $D \to S \to L^p$  are continuous (immersion) but not imply closed subspaces (embedding).

#### General topology:

•  $H \subset \mathbb{C}$  and  $H \subset \widehat{\mathbb{C}}$  have distinct Cauchy structures which give a same topology. In addition, the latter is precompact while the former is not.

## 3 Algebraic closure

Theorem 3.1. Every field has an algebraic closure.

*Proof.* Let F be a field.

Step 1: -NoValue-Construct an algebraically closed field containing F. Let S be a set of irreducibles or nonconstants in F[x].(anyone is fine) Define  $R := F[\{x_p\}_{p \in S}]$ . Let I be an ideal in R generated by  $p(x_p)$  as p runs through all S. It has a maximal ideal  $\mathfrak{m} \supset I$ .

Define  $K_1 := R/\mathfrak{m}$ . Every nonconstant  $f \in F[x]$  has a root in  $K_1$ . (In fact, this  $K_1$  is already algebraically closed, but it's hard to prove.) Construct  $K_2, \cdots$  such that every nonconstant  $f \in K_n[x]$  has a root in  $K_{n+1}$ . Define  $K = \lim_{\to} K_n$ . Then, K is algebraically closed.

Step 2: -NoValue-Construct the algebraic closure of F. Let  $\overline{F}$  be the set of all algebraic elements of K over F. Then, this is the algebraic closure.  $\square$ 

## 4 Space curve theory

**Definition 4.1.** Let  $\alpha$  be a curve.

$$\mathbf{T} := \frac{\alpha'}{\|\alpha'\|}, \quad \mathbf{N} := \frac{\mathbf{T}'}{\|\mathbf{T}'\|}, \quad \mathbf{B} := \mathbf{T} \times \mathbf{N}.$$

Proposition 4.1. T', B', N are collinear.

Definition 4.2.

$$s(t) := \int_0^t \|\alpha'\|, \quad \kappa := \frac{d\mathbf{T}}{ds} \cdot \mathbf{N}, \quad \tau := -\frac{d\mathbf{B}}{ds} \cdot \mathbf{N}.$$

**Theorem 4.2** (Frenet-Serret formula). Let  $\alpha$  be a unit speed curve.

$$\begin{pmatrix} \mathbf{T}' \\ \mathbf{N}' \\ \mathbf{B}' \end{pmatrix} = \begin{pmatrix} 0 & \kappa & 0 \\ -\kappa & 0 & \tau \\ 0 & -\tau & 0 \end{pmatrix} \begin{pmatrix} \mathbf{T} \\ \mathbf{N} \\ \mathbf{B} \end{pmatrix}.$$

**Theorem 4.3.** Let  $\alpha$  be a unit speed curve.

$$\alpha' = \mathbf{T}$$

$$\alpha'' = \kappa \mathbf{N}$$

$$\alpha''' = -\kappa^2 \mathbf{T} + \kappa' \mathbf{N} + \kappa \tau \mathbf{B}$$

$$\kappa = \|\alpha''\|, \quad \tau \frac{[\alpha' \alpha'' \alpha''']}{\kappa^2}.$$

**Theorem 4.4.** Let  $\alpha$  be a curve.

$$\alpha' = s'\mathbf{T}$$

$$\alpha'' = s''\mathbf{T} + s'^{2}\kappa\mathbf{N}$$

$$\alpha''' = (s''' - s'^{3}\kappa^{2})\mathbf{T} + (3s's''\kappa + s'^{2}\kappa')\mathbf{N} + s'^{3}\kappa\tau\mathbf{B}$$

$$\kappa = \frac{\|\alpha' \times \alpha''\|}{\|\alpha'\|^{3}}, \quad \tau = \frac{[\alpha'\alpha''\alpha''']}{\|\alpha' \times \alpha''\|}.$$

Problem solving strategy:

• Represent  $\alpha$  and its derivatives over the Frenet basis.

•

Uniqueness: The Frene-Serret formula is an ODE for the vector (of vectors)  $(\mathbf{T}, \mathbf{N}, \mathbf{B})$ . After showing this equation preserves orthonormality, obtain  $\alpha$  by integratin  $\mathbf{T}$ . The skew-symmetry implies that  $\|\mathbf{T}\|^2 + \|\mathbf{N}\|^2 + \|\mathbf{B}\|^2$  is constant.

## 5 Algebraic integer

#### 5.1 Quadratic integer

**Theorem 5.1.** Every quadratic field is of the form  $\mathbb{Q}(\sqrt{d})$  for a square-free d.

**Theorem 5.2.** Let d be a square-free.

$$\mathcal{O}_{\mathbb{Q}(\sqrt{d})} = \begin{cases} \mathbb{Z} + \sqrt{d}\mathbb{Z} & , d \equiv 2, 3 \pmod{4} \\ \mathbb{Z} + \frac{1 + \sqrt{d}}{2}\mathbb{Z} & , d \equiv 1 \pmod{4} \end{cases}$$

$$\Delta_{\mathbb{Q}(\sqrt{d})} = \begin{cases} 4d & , d \equiv 2, 3 \pmod{4} \\ d & , d \equiv 1 \pmod{4} \end{cases}$$

**Theorem 5.3.** Let  $\theta^3 = hk^2$  for h, k square-free's.

$$\mathcal{O}_{\mathbb{Q}(\theta)} = \begin{cases} \mathbb{Z} + \sqrt[3]{hk^2}\mathbb{Z} + \sqrt[3]{h^2k}\mathbb{Z} &, m \not\equiv \pm 1 \pmod{9} \\ \mathbb{Z} + \theta\mathbb{Z} + \frac{\theta^2 \pm \theta k + k^2}{3k}\mathbb{Z} &, m \equiv \pm 1 \pmod{9} \end{cases}$$

#### 5.2 Integral basis

**Theorem 5.4.** Let  $\alpha \in K$ .  $Tr_K(\alpha) \in \mathbb{Z}$  if  $\alpha \in \mathcal{O}_K$ .  $N_K(\alpha) \in \mathbb{Z}$  if and only if  $\alpha \in \mathcal{O}_K$ .

**Theorem 5.5.** Let  $\{\omega_1, \dots, \omega_n\}$  be a basis of K over  $\mathbb{Q}$ . If  $\Delta(\omega_1, \dots, \omega_n)$  is square-free, then  $\{\omega_1, \dots, \omega_n\}$  is an integral basis.

**Theorem 5.6.** Let  $\{\omega_1, \dots, \omega_n\}$  be a basis of K over  $\mathbb{Q}$  consisting of algebraic integers. If  $p^2 \mid \Delta$  and it is not an integral basis, then there is a nonzero algebraic integer of the form

$$\frac{1}{p} \sum_{i=1}^{n} \lambda_i \omega_i.$$

#### 5.3 Fractional ideals

**Theorem 5.7.** Every fractional ideal of K is a free  $\mathbb{Z}$ -module with rank  $[K, \mathbb{Q}]$ .

*Proof.* This theorem holds because  $K/\mathbb{Q}$  is separable and  $\mathbb{Z}$  is a PID.

## 6 Diophantine equations

The reciprocity laws let us know not only what primes split, but also what prime factors a polynomial has.

#### 6.1 The Mordell equations

$$y^2 = x^3 + k$$

There are two strategies for the Mordell equations:

- $x^2 2x + 4$  has a prime factor of the form 4k + 3
- $x^3 = N(y a)$  for some a.

First case: k = 7, -5, -6, 45, 6, 46, -24, -3, -9, -12.

**Example 6.1.** Solve  $y^2 = x^3 + 7$ .

*Proof.* Taking mod 8, x is odd and y is even. Consider

$$y^2 + 1 = (x+2)(x^2 - 2x + 4).$$

Since

$$x^2 - 2x + 4 = (x - 1)^2 + 3$$
,

there is a prime  $p \equiv 3 \pmod 4$  that divides the right hand side. Taking mod p, we have

$$y^2 \equiv -1 \pmod{p},$$

which is impossible. Therefore, the equation has no solutions.

**Example 6.2.** Solve  $y^2 = x^3 - 2$ .

*Proof.* Taking mod 8, x and y are odd. Consider a ring of algebraic integers  $\mathbb{Z}[\sqrt{-2}]$ . We have

$$N(y - \sqrt{-2}) = (y - \sqrt{-2})(y + \sqrt{-2}) = x^3.$$

For a common divisor  $\delta$  of  $y \pm \sqrt{-2}$ , we have

$$N(\delta) \mid N((y - \sqrt{-2}) - (y + \sqrt{-2})) = N(2\sqrt{-2}) = |(2\sqrt{-2})(-2\sqrt{-2})| = 8.$$

On the other hand,

$$N(\delta) \mid x^3 \equiv 1 \pmod{2},$$

so  $N(\delta)=1$  and  $\delta$  is a unit. Thus,  $y\pm\sqrt{-2}$  are relatively prime. Since the units in  $\mathbb{Z}[\sqrt{-2}]$  are  $\pm 1$ , which are cubes,  $y\pm\sqrt{-2}$  are cubics in  $\mathbb{Z}[\sqrt{-2}]$ . Let

$$y + \sqrt{-2} = (a + b\sqrt{-2})^3 = a(a^2 - 6b^2) + b(3a^2 - 2b^2)\sqrt{-2},$$

so that  $1 = b(3a^2 - 2b^2)$ . We can conclude  $b = \pm 1$ . The possible solutions are  $(x, y) = (3, \pm 5)$ , which are in fact solutions.

## 7 The local-global principle

#### 7.1 The local fields

Let  $f \in \mathbb{Z}[x]$ .

Does 
$$f = 0$$
 have a solution in  $\mathbb{Z}$ ?

Does  $f = 0$  have a solution in  $\mathbb{Z}/(p^n)$  for all  $n$ ?

Does  $f = 0$  have a solution in  $\mathbb{Z}_p$ ?

In the first place, here is the algebraic definition.

**Definition 7.1.** Let  $p \in \mathbb{Z}$  be a prime. The ring of the p-adic integers  $\mathbb{Z}_p$  is defined by the inverse limit:

$$\mathbb{Z}_p := \lim_{\substack{n \in \mathbb{N} \\ n \in \mathbb{N}}} \mathbb{F}_{p^n} \longrightarrow \cdots \longrightarrow \mathbb{Z}/(p^3) \longrightarrow \mathbb{Z}/(p^2) \longrightarrow \mathbb{F}_p.$$

**Definition 7.2.**  $\mathbb{Q}_p = \operatorname{Frac} \mathbb{Z}_p$ .

Secondly, here is the analytic definition.

**Definition 7.3.** Let  $p \in \mathbb{Z}$  be a prime. Define a absolute value  $|\cdot|_p$  on  $\mathbb{Q}$  by  $|p^m a|_p = \frac{1}{p^m}$ . The local field  $\mathbb{Q}_p$  is defined by the completion of  $\mathbb{Q}$  with respect to  $|\cdot|_p$ .

**Definition 7.4.**  $\mathbb{Z}_p := \{x \in \mathbb{Q}_p : |x|_p \leq 1\}.$ 

Example 7.1. Observe

$$3^{-1} \equiv 2_5 \pmod{5}$$
  
 $\equiv 32_5 \pmod{5^2}$   
 $\equiv 132_5 \pmod{5^3}$   
 $\equiv 1313132_5 \pmod{5}^7 \cdots$ 

Therefore, we can write

$$3^{-1} = \overline{13}2_5 = 2 + 3p + p^2 + 3p^3 + p^4 + \cdots$$

for p = 5. Since there is no negative power of 5,  $3^{-1}$  is a p-adic integer for p = 5.

#### Example 7.2.

$$7 \equiv 1_3^2 \pmod{3}$$

$$\equiv 111_3^2 \pmod{3^3}$$

$$\equiv 20111_3^2 \pmod{3^5}$$

$$\equiv 120020111_3^2 \pmod{3^9} \cdots$$

Therefore, we can write

$$\sqrt{7} = \cdots 120020111_3 = 1 + p + p^2 + 2p^4 + 2p^7 + p^8 + \cdots$$

for p=3. Since there is no negative power of 3,  $\sqrt{7}$  is a p-adic integer for p=3.

There are some pathological and interesting phenomena in local fields. Actually note that the values of  $|\cdot|_p$  are totally disconnected.

**Theorem 7.3.** The absolute value  $|\cdot|_p$  is nonarchimedean: it satisfies  $|x+y|_p \le \max\{|x|_p,|y|_p\}$ .

**Theorem 7.4.** Every triangle in  $\mathbb{Q}_p$  is isosceles.

**Theorem 7.5.**  $\mathbb{Z}_p$  is a discrete valuation ring: it is local PID.

Proof. asdf 
$$\Box$$

**Theorem 7.6.**  $\mathbb{Z}_p$  is open and compact. Hence  $\mathbb{Q}_p$  is locally compact Hausdorff.

*Proof.*  $\mathbb{Z}_p$  is open clearly. Let us show limit point compactness. Let  $A \subset \mathbb{Z}_p$  be infinite. Since  $\mathbb{Z}_p$  is a finite union of cosets  $p\mathbb{Z}_p$ , there is  $\alpha_0$  such that  $A \cap (\alpha_0 + p\mathbb{Z}_p)$  is infinite. Inductively, since

$$\alpha_n + p^{n+1} \mathbb{Z}_p = \bigcup_{1 \le x < p} (\alpha_n + xp^{n+1} + p^{n+2} \mathbb{Z}_p),$$

we can choose  $\alpha_{n+1}$  such that  $\alpha_n \equiv \alpha_{n+1} \pmod{p^{n+1}}$  and  $A \cap (\alpha_{n+1} + p^{n+2}\mathbb{Z}_p)$  is infinite. The sequence  $\{\alpha_n\}$  is Cauchy, and the limit is clearly in  $\mathbb{Z}_p$ .

#### 7.2 Hensel's lemma

**Theorem 7.7** (Hensel's lemma). Let  $f \in \mathbb{Z}_p[x]$ . If f has a simple solution in  $\mathbb{F}_p$ , then f has a solution in  $\mathbb{Z}_p$ .

Proof. asdf 
$$\Box$$

*Remark.* Hensel's lemma says: for X a scheme over  $\mathbb{Z}_p$ , X is smooth iff  $X(\mathbb{Z}_p) \twoheadrightarrow X(\mathbb{F}_p)$ ...???

**Example 7.8.**  $f(x) = x^p - x$  is factorized linearly in  $\mathbb{Z}_p[x]$ .

#### 7.3 Sums of two squares

**Theorem 7.9** (Euler). A positive integer m can be written as a sum of two squares if and only if  $v_p(m)$  is even for all primes  $p \equiv 3 \pmod{4}$ .

**Lemma 7.10.** Let p be a prime with  $p \equiv 1 \pmod{4}$ . Every p-adic integer is a sum of two squares of p-adic integers.

## 8 Ultrafilter

**Theorem 8.1.** Let  $\mathcal{U}$  be an ultrafilter on a set S and X be a compact space. For  $f: S \to X$ , the limit  $\mathcal{U}$ -lim f always exists.

**Theorem 8.2.** Let  $X = \prod_{\alpha \in \mathcal{A}} X_{\alpha}$  be a product space of compact spaces  $X_{\alpha}$ . A net  $\{f_d\}_{d \in \mathcal{D}}$  on X has a convergent subnet.

*Proof 1.* Use Tychonoff. Compactness and net compactness are equivalent.  $\Box$ 

Proof 2. It is a proof without Tychonoff. Let  $\mathcal{U}$  be a ultrafilter on a set  $\mathcal{D}$  contatining all  $\uparrow d$ . Define a directed set  $\mathcal{E} = \{(d, U) \in \mathcal{D} \times \mathcal{U} : d \in U\}$  as  $(d, U) \prec (d', U')$  for  $U \supset U'$ . Let  $f : \mathcal{E} \to X$  be a net defined by  $f_{(d,U)} = f_d$ .

By the previous theorem,  $\mathcal{U}$ -lim  $\pi_{\alpha}f_d$  exsits for each  $\alpha$ . Define  $f \in X$  such that  $\pi_{\alpha}f = \mathcal{U}$ -lim  $\pi_{\alpha}f_d$ . Let  $G = \prod_{\alpha} G_{\alpha} \subset X$  be any open neighborhood of f where  $G_{\alpha} = X_{\alpha}$  except finite. Then  $G_{\alpha}$  is an open neighborhood of  $\pi_{\alpha}f$  so that we have  $U_{\alpha} := \{d : \pi_{\alpha}f_d \in G_{\alpha}\} \in \mathcal{U}$  by definition of convergence with ultrafilter.9 Since  $U_{\alpha} = \mathcal{D}$  except finites, we can take an upper bound  $U_0 \in \mathcal{U}$ . Then, by taking any  $d_0 \in U_0$ , we have  $f_{(d,U)} \in G$  for every  $(d,U) \succ (d_0,U_0)$ . This means  $f = \lim_{\mathcal{E}} f_{(d,U)}$ , so we can say  $\lim_{\mathcal{E}} f_{(d,U)}$  exists.

## 9 Universal coefficient theorem

Lemma 9.1. Suppose we have a flat resolution

$$0 \longrightarrow P_1 \longrightarrow P_0 \longrightarrow A \longrightarrow 0.$$

Then, we have a exact sequence

$$\cdots \to 0 \to \operatorname{Tor}_1^R(A,B) \to P_1 \otimes B \to P_0 \otimes B \to A \otimes B \to 0.$$

**Theorem 9.2.** Let R be a PID. Let  $C_{\bullet}$  be a chain complex of flat R-modules and G be a R-module. Then, we have a short exact sequence

$$0 \longrightarrow H_n(C) \otimes G \longrightarrow H_n(C;G) \longrightarrow \operatorname{Tor}(H_{n-1}(C),G) \longrightarrow 0,$$

which splits, but not naturally.

*Proof 1.* We have a short exact sequence of chain complexes

$$0 \longrightarrow Z_{\bullet} \longrightarrow C_{\bullet} \longrightarrow B_{\bullet-1} \longrightarrow 0$$

where every morphism in  $Z_{\bullet}$  and  $B_{\bullet}$  are zero. Since modules in  $B_{\bullet-1}$  are flat, we have a short exact sequence

$$0 \to Z_{\bullet} \otimes G \to C_{\bullet} \otimes G \to B_{\bullet-1} \otimes G \to 0$$

and the associated long exact sequence

$$\cdots \to H_n(B;G) \to H_n(Z;G) \to H_n(C;G) \to H_{n-1}(B;G) \to H_{n-1}(Z;G) \to \cdots$$

where the connecting homomomorphisms are of the form  $(i_n \colon B_n \to Z_n) \otimes 1_G$  (It is better to think diagram chasing than a natural construction). Since morphisms in B and Z are zero (if it is not, then the short exact sequence of chain complexes are not exact, we have

$$\cdots \to B_n \otimes G \to Z_n \otimes G \to H_n(C;G) \to B_{n-1} \otimes G \to Z_{n-1} \otimes G \to \cdots$$

Since

$$0 \to \operatorname{Tor}_1^R(H_n, G) \to B_n \otimes G \to Z_n \otimes G \to H_n \otimes G \to 0$$

for all n, the exact sequence splits into short exact sequence by images

$$0 \longrightarrow H_n \otimes G \longrightarrow H_n(C;G) \longrightarrow \operatorname{Tor}_1^R(H_{n-1},G) \longrightarrow 0.$$

For splitting,  $\Box$ 

*Proof 2.* Since R is PID, we can construct a flat resolution of G

$$0 \longrightarrow P_1 \longrightarrow P_0 \longrightarrow G \longrightarrow 0.$$

Since modules in  $C_{\bullet}$  are flat so that the tensor product functors are exact and  $P_1 \to P_0$  and  $P_0 \to G$  induce the chain maps, we have a short exact sequence of chain complexes

$$0 \to C_{\bullet} \otimes P_1 \to C_{\bullet} \otimes P_0 \to C_{\bullet} \otimes G \to 0.$$

Then, we have the associated long exact sequence

$$\cdots \to H_n(C; P_1) \to H_n(C; P_0) \to H_n(C; G) \to H_{n-1}(C; P_1) \to H_{n-1}(C; P_0) \to \cdots$$

Since flat tensor product functor commutes with homology funtor from chain complexes, we have

$$\cdots \to H_n \otimes P_1 \to H_n \otimes P_0 \to H_n(C;G) \to H_{n-1} \otimes P_1 \to H_{n-1} \otimes P_0 \to \cdots$$

Since

$$0 \to \operatorname{Tor}_1^R(G, H_n) \to H_n \otimes P_1 \to H_n \otimes P_0 \to H_n \otimes G \to 0$$

for all n, the exact sequence splits into short exact sequence by images

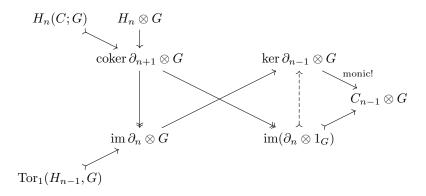

$$0 \to H_n \otimes G \to H_n(C;G) \to \operatorname{Tor}_1^R(G,H_{n-1}) \to 0.$$

*Proof 3.* (??) By tensoring G, we get the following diagram.

 $H_n \otimes G$   $H_{n-1} \otimes G$   $\operatorname{coker} \partial_{n+1} \otimes G \quad \ker \partial_{n-1} \otimes G$   $\operatorname{coker} \partial_n \otimes G \quad C_{n-1} \otimes G$   $\operatorname{im} \partial_n \otimes G$   $\operatorname{Tor}_1(H_{n-1}, G)$ 

Every aligned set of consecutive arrows indicates an exact sequence. Notice that epimorphisms and cokernals are preserved, but monomorphisms and kernels are not. Especially, coker  $\partial_{n+1}\otimes G=\operatorname{coker}(\partial_{n+1}\otimes 1_G)$  is important.

Consider the following diagram.

Since  $\ker \partial_{n-1}$  is free,

If we show  $\operatorname{im}(\partial_n \otimes 1_G) \to \ker \partial_{n-1} \otimes G$  is monic, then we can get

$$H_n(C;G) = \ker(\operatorname{coker} \partial_{n+1} \otimes G \to \operatorname{im}(\partial_n \otimes 1_G))$$
  
=  $\ker(\operatorname{coker} \partial_{n+1} \otimes G \to \ker \partial_{n-1} \otimes G).$ 

## 10 Estimates

**Theorem 10.1.** The following series diverges:

$$\sum_{n=1}^{\infty} \frac{1}{n^{1+|\sin n|}}.$$

*Proof.* Let  $A_k := [1, 2^k] \cap \{x : |\sin x| < \frac{1}{k}\}$ . Divide the unit circle  $\mathbb{R}/2\pi\mathbb{Z}$  by 7k uniform arcs. There are at least  $2^k/7k$  integers that are not exceed  $2^k$  and are in a same arc. Let S be the integers and  $x_0$  be the smallest element. Since,  $|x - x_0| \pmod{2\pi} < \frac{2\pi}{7k}$  for  $x \in S$ ,

$$|\sin(x-x_0)| < |x-x_0| \pmod{2\pi} < \frac{2\pi}{7k} < \frac{1}{k}.$$

Also,  $1 \le x - x_0 \le x \le 2^k$ ,  $x - x_0 \in A_k$ .

$$|A_k| \ge \frac{2^k}{7k}.$$

Therefore,

$$\sum_{n=1}^{\infty} \frac{1}{n^{1+|\sin n|}} \ge \sum_{n \in A_N} \frac{1}{n^{1+|\sin n|}}$$

$$\ge \sum_{k=1}^{N} (|A_k| - |A_{k-1}|) \frac{1}{2^{k+1}}$$

$$= \sum_{k=1}^{N} \frac{|A_k|}{2^{k+1}} - \sum_{k=1}^{N-1} \frac{|A_k|}{2^{k+2}}$$

$$= \frac{|A_N|}{2^{N+1}} + \sum_{k=1}^{N-1} \frac{|A_k|}{2^{k+2}}$$

$$> \sum_{k=1}^{N} \frac{2^k}{2^{k+2}} \frac{1}{7k}$$

$$= \frac{1}{28} \sum_{k=1}^{N} \frac{1}{k}$$

**Theorem 10.2.** If  $|xf'(x)| \leq M$  and  $\frac{1}{x} \int_0^x f(y) dy \to L$ , then  $f(x) \to L$  as  $x \to \infty$ .

Proof. Since

$$\left| f(x) - \frac{F(x) - F(a)}{x - a} \right| \le \frac{1}{x - a} \int_a^x |f(x) - f(y)| \, dy$$

$$= \frac{1}{x - a} \int_a^x (x - y)|f'(c)| \, dy$$

$$\le \frac{M}{x - a} \int_a^x \frac{x - y}{c} \, dy$$

$$\le M \frac{x - a}{a}$$

by the mean value theorem and

$$f(x) - L = \left[ f(x) - \frac{F(x) - F(a)}{x - a} \right] + \frac{x}{x - a} \left[ \frac{F(x)}{x} - L \right] + \frac{a}{x - a} \left[ \frac{F(a)}{a} - L \right],$$

we have for any  $\varepsilon > 0$ 

$$\limsup_{x \to \infty} |f(x) - L| \le \varepsilon$$

where a is defined by  $\frac{x-a}{a} = \frac{\varepsilon}{M}$ .

## 11 Action

#### Definition

- $G \curvearrowright X$ 
  - fcn  $G \times X \to X$ : compatibility, identity
  - hom  $\rho$ : G → Sym(X) or Aut(X)
  - funtor from G
  - nt) X is called G-set.
  - nt)  $\rho$  is called permutation repr.
  - \* right action is a contravariant functor.
- $\operatorname{Stab}_G(x) = G_x$ ,  $\operatorname{Orb}_G(x) = G.x$ 
  - Orbit-stabilizer theorem
    - pf) quotient with  $-.x: G \to X$ .
    - \* this is not the first isom.
  - \* stabilizer is also called isotropy group.
- Faithfulness, Transitivity

#### **Useful Actions**

- \* these actions are on P(G).
  - Left Multiplication

$$-\operatorname{Stab}(A) = AA^{-1}$$

eg) 
$$G \curvearrowright G/H$$
, for  $H \le G$   
 $\ker \rho = \bigcap xHx^{-1} = \operatorname{Core}_G(H)$ 

- Conjugation
  - $-\operatorname{Stab}(A) = N_G(A)$

eg) 
$$G \curvearrowright \{\{h\} : h \in H\}$$
, for  $H \triangleleft G$ 

$$\ker \rho = C_G(H), \text{ im } \rho \subset \operatorname{Aut}(H)$$

- eg)  $G \curvearrowright \operatorname{Syl}_p$
- \* conjugation is an isomorphism.

## Sylow Theorem

- $\operatorname{Syl}_p \neq \varnothing$
- $n_p = kp + 1 \mid [G : \overline{P}]$
- $\begin{array}{c} \bullet \ G \curvearrowright \operatorname{Syl}_p \ \text{transitive} \\ pf) \ \text{four actions by conjugation:} \\ G \curvearrowright G, \quad \overline{P}, G, P \curvearrowright \operatorname{Orb}_G(\overline{P}). \end{array}$

EXERCISES

## 12 Some problems

#### Problems I made:

- 1. Let f be  $C^2$  with  $f''(c) \neq 0$ . Defined a function  $\xi$  such that  $f(x) f(c) = f'(\xi(x))(x-c)$  with  $|\xi c| \leq |x-c|$ , show that  $\xi'(c) = 1/2$ .
- 2. Let f be a  $C^2$  function such that f(0)=f(1)=0. Show that  $\|f\|\leq \frac{1}{8}\|f''\|.$
- 3. Show that a measurable subset of  $\mathbb{R}$  with positive measure contains an arbitrarily long subsequence of an arithmetic progression.
- 4. Show that there is no continuous bijection from  $[0,1]^2 \setminus \{p\}$  to  $[0,1]^2$ .
- 1. Show that for a nonnegative sequence  $a_n$  if  $\sum a_n$  diverges then  $\sum \frac{a_n}{1+a_n}$  also diverges.
- 2. Show that if both limits of a function and its derivative exist at infinity then the former is 0.
- 3. Show that every real sequence has a monotonic subsequence that converges to the limit superior of the supersequence.
- 4. Show that if a decreasing nonnegative sequence  $a_n$  converges to 0 and satisfies  $S_n \leq 1 + na_n$  then  $S_n$  is bounded by 1.
- 5. Show that the set of local minima of a convex function is connected.
- 6. Show that a smooth function such that for each x there is n having the nth derivative vanish is a polynomial.
- 7. Show that if a continuously differentiable f satisfies  $f(x) \neq 0$  for f'(x) = 0, then in a bounded set there are only finite points at which f vanishes.
- 8. Let a function f be differentiable. For a < a' < b < b' show that there exist a < c < b and a' < c' < b' such that f(b) f(a) = f'(c)(b a) and f(b') f(a') = f'(c')(b' a').
- 9. Show that if xf'(x) is bounded and  $x^{-1}\int_0^x f \to L$  then  $f(x) \to L$  as  $x \to \infty$ .
- 10. Show that if a sequence of real functions  $f_n : [0,1] \to [0,1]$  satisfies  $|f(x) f(y)| \le |x-y|$  whenever  $|x-y| \ge \frac{1}{n}$ , then the sequence has a uniformly convergent subsequence.
- 11. (Flett)
- 12. Let f be a differentiable function with f(0) = 0. Show that there is  $c \in (0,1)$  such that cf(c) = (1-c)f'(c).

- 13. Find the value of  $\lim_{n\to\infty} \frac{1}{n} \left( \sum_{k=1}^n \frac{1}{n} f\left(\frac{k}{n}\right) \int_0^1 f(x) dx \right)$ .
- 14. Let f be a continuous function. Show that f(x)=c cannot have exactly two solutions for every c.
- 15. Show that a continuous function that takes on no value more than twice takes on some value exactly once.
- 16. Let f be a function that has the intermediate value property. Show that if the preimage of every singleton is closed, then f is continuous.
- 17. Show that if a holomorphic function has positive real parts on the open unit disk then  $|f'(0)| < 2 \operatorname{Re} f(0)$ .
- 18. Show that if at least one coefficient in the power series of a holomorphic function at each point is 0 then the function is a polynomial.
- 19. Show that if a holomorphic function on a domain containing the closed unit disk is injective on the unit circle then so is on the disk.
- 20. Show that for a holomorphic function f and every  $z_0$  in the domain there are  $z_1 \neq z_2$  such that  $\frac{f(z_1) f(z_2)}{z_1 z_2} = f'(z_0)$ .
- 21. For two linearly independent entire functions, show that one cannot dominate the other.
- 22. Show that uniform limit of injective holomorphic function is either constant or injective.
- 23. Suppose the set of points in a domain  $U \subset \mathbb{C}$  at which a sequence of bounded holomorphic functions  $(f_n)$  converges has a limit point. Show that  $(f_n)$  compactly converges.
- 24. Show that normal nilpotent matrix equals zero.
- 25. Show that two matrices AB and BA have same nonzero eigenvalues whose both multiplicities are coincide blabla...
- 26. Show that if A is a square matrix whose characteristic polynomial is minimal then a matrix commuting A is a polynomial in A.
- 27. Show that if two by two integer matrix is a root of unity then its order divides 12.
- 28. Show that a finite symmetric group has two generators.
- 29. Show that a nontrivial normalizer of a *p*-group meets its center out of identity.
- 30. Show that a proper subgroup of a finite p-group is a proper subgroup of its normalizer. In particular, every finite p-group is nilpotent.

- 31. Show that the complement of a saturated monoid in a commutative ring is a union of prime ideals.
- 32. Show that the Galois group of a quintic over  $\mathbb{Q}$  having exactly three real roots is isomorphic to  $S_5$ .
- 33. Show that if  $A^{\circ} \in B$  and B is closed, then  $(A \cup B)^{\circ} \subset B$ .
- 34. Show that the tangent space of the unitary group at the identity is identified with the space of skew Hermitian matrices.
- 35. Prove the Jacobi formula for matrix.
- 36. Show that  $S^3$  and  $T^2$  are parallelizable.
- 37. Show that  $\mathbb{R}P^n = S^n/Z_2$  is orientable if and only if n is odd.
